If your organization uses the Exchange file transfer mechanism for data exchange, there is a high probability you would need to encounter issues when dealing with EDI formatted data. People often confuse EDI with EDC, which could result in the fact that companies are often not able to exchange data with each other. To address this issue, Mini Translator provides a tool to convert Exchange data or CSV files that comply with the EDI standard. As a result, it is possible to employ the standard to send data as part of an EDI report. Using Exchange file transfer, data can be sent from one Exchange mailbox to another. However, there are instances where a company would need to send a standardized report containing data formatted according to a well-established EDI standard. When faced with these issues, companies often look for software or services that can help them generate such EDI reports in a timely and efficient manner. Thanks to the need for standardization, a new standard to transfer data has been introduced: EDI X12. The standardized and well-established protocol can be used to send any type of data.
