These cells are often found floating at the surface, and their soft, transparent bodies can easily be mistaken for eggs. While it's not known what they do or where they live, they are often deadly. Jellyfish are notorious for releasing a stinging neurotoxin that kills. Though a full understanding of the toxic compound is lacking, researchers are closing in on the answers and surprisingly, jellyfish are helping to lead the way. Turns out there's a lot more to jellyfish than meets the eye. We spoke with Michael Harbison, a researcher at the National Oceanography Centre, Southampton, who explains the importance of research with these creatures and how scientists are finding new ways to use jellyfish to help us learn more about the ocean. What is a Jellyfish? Jellyfish are named for the gooey substance that surrounds their bell-shaped bodies. The fluid is a mixture of monosodium glutamate and sugars, which gives the bodies their distinctive sweet taste.

When you visit the site, you will find that many articles and most of them are very professional. We have a lot of free software as free download. Enjoy the software you want! The Department of Health and Human Services (HHS) recently announced that it will implement the Community First Choice health insurance program across the country. The Community First Choice program will open up subsidized private coverage to people with incomes below the Medicaid eligibility limit and who do not have other insurance coverage. The Community First Choice program would allow states to provide an opportunity for individuals to access affordable insurance coverage, including prescription drugs, without breaking the bank. States would have the option of expanding Medicaid, to offer subsidized coverage to individuals and families with incomes up to 133% of the federal poverty level. And the federal government would provide support to low-income families who would obtain private insurance coverage via HealthCare.gov. The combination of two Medicaid expansion strategies would make a significant difference for people with low incomes in the states that adopt the plan. While the enrollment thresholds for the Medicaid expansion vary, the majority of states offer coverage to individuals with incomes as low as 100% of the federal poverty level and families with incomes as low as 138% of poverty. The available evidence indicates that Medicaid expansion increases access to health insurance coverage, improves quality of care and improves overall health outcomes for people with low incomes. The Community First Choice program will augment this expanded coverage. Not only does Medicaid expansion

improve access to coverage for low-income people, it also avoids two costs of providing coverage to individuals in the private insurance market. Enrollment in Medicaid is more affordable than private insurance for poor people, so the out-of-pocket costs are much lower for individuals who would not qualify for subsidies in the private insurance market. Furthermore, Medicaid encourages healthier behaviors because low-income people enrolled in Medicaid are more likely to enroll in regular primary care, have fewer out-of-pocket visits and are less likely to use emergency services than are individuals who receive private insurance. The Communities First Choice program has a lot of potential to be a landmark for health care reform. The program would also reduce uncompensated care costs for hospitals and other health care providers who are providing care at hospitals to uninsured patients, offsetting out-of-pocket costs for emergency f30f4ceada
